Reviewer's report

Title: Work capacity and health-related quality of life among individuals with multiple sclerosis reduced by fatigue: A cross-sectional study

Version: 1 Date: 31 October 2012

Reviewer: Afshin Borhani Haghighi

Reviewer's report:

Flensner et al studied the correlation between work capacity, quality of life and fatigue in Swedish MS patients.

Abstract has 393 words currently. It should be truncated to 250 words.

Introduction is long. Professional reader may skip some sentences.

Method part is comprehensive and reproducible. As Multiple Sclerosis Quality of Life Questionnaire (MSQoL-54) has been validated as a specific health related questionnaire for MS patients, it was better to explain why respected researchers chose HRQoL as a nonspecific questionnaire.

Results were reported in an organized manner. Tables did not reformulate the text data.

Discussion is relevant as well.

To some up, this manuscript can be considered for publication in your journal with minor revision.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
