Reviewer's report

Title: Auditory dysfunction associated with solvent exposure

Version: 1 Date: 14 October 2012

Reviewer: Dimitrios Balatsouras

Reviewer's report:

This is an interesting well designed and written study, Statistical analysis is appropriate and the results are useful, although these confirm similar findings from previous reports. I have one remark only: In the "Methods" section, the authors notice write that "The presence of a TEOAE response was primarily determined by analysing the reproducibility of the resultant full waveform". However, it seems from the results that they mainly use (as they should do) the amplitudes of TEOAEs.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
