Title: Using environmental health officers' opinions to inform the source attribution of enteric disease: further analysis of the "most likely source of infection"

Version: 1 Date: 30 October 2014

Reviewer: Cameron Clark

Reviewer's report:

Discretionary Revisions

- Environmental Health Officer experience could examine years of experience in terms of interview skills which may be more pertinent in explaining expert elicitation and lower or higher odds of entering a certain type of exposure in MLSI field compared to the other EHOS
- I believe, within Discussion, that the challenges in data collection methods and subsequent analysis, would not necessarily be overcome with a qualitative scale regarding the EHOs decision. Training on clarification of exposure and risk setting would be a better avenue to pursue

Minor Essential Revisions

- Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
