Reviewer's report

Title: Prevalence and associated factors for hypertension among adults Kabul citizens- Afghanistan, 2012

Version: 2  Date: 10 December 2013

Reviewer: bülent altun

Reviewer's report:

Major
1. Hypertension is defined just on blood pressure values however subjects who have a history of high blood pressure should be also added to the hypertensive group and all data should be reevaluated.
2. First of all prevalence awareness and treatment, age distribution, of hypertension should be in results clearly.
3. Data on different countries in references is not up to date.
4. Too much data about risk factors, some of them is not related to hypertension.
5. References are not on line

Level of interest: An article of limited interest

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
