Title: Non-adherence to self-care practices & medication and health related quality of life among patients with type 2 diabetes: a cross-sectional study

Version: 4 Date: 30 March 2014

Reviewer: Husref Tahirovic

Reviewer's report:

The Manuscript by Farzana Saleh et al. entitled “Non-adherence to self-care practices and medication and health related quality of life among patients with type 2 diabetes: a cross-sectional study” is aimed to evaluate the association between non-adherence to self-care practices, medication and health related quality of life among Bangladeshi type 2 diabetic patients. This is interesting study and well done and convincing.

I have several comments:

- The title is long. I suggest delete “a cross-sectional study”
- In the text of section of Results there is a description "Distribution of patients according to non-adherence to their self-care practices and medication," and "Profile of the health related quality of life (HR-QoL) among the patients," all these details are given in the Figure 1 and Figure 2. The authors should make a choice: either detail in text or in figures. I would suggest that the remaining two Figures. Also suggest that in Figures 2 to delete the data, "No problem."
- At the end of the discussion write limitation of this study as separate paragraph.
- Statistical review is needed.
- English language should be improved.
