Title: Sleep Duration, Snoring Habits and risk of acute myocardial infarction in China population: results of the INTERHEART study

Version: 1 Date: 16 March 2014

Reviewer: Michael Grandner

Reviewers report:

Major Compulsory Revisions (which the author must respond to before a decision on publication can be reached)

- The authors note that the prevalence of short sleep duration has only increased by 2% of the population. That does not seem to be a large problem.

- For "Self-reported" variable, how were they self-reported? What were the specific items used?

- Family income was divided into groups -- these should be spelled out at first mention.

- The specific sleep items need to be spelled out.

- The exact wordings of items need to be provided if it was an independent or dependent variable.

- The authors should note the cooperation rate of the sample.

- Was the sample representative? Please provide information as to the generalizability of the sample.

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

- In the abstract, the first line should say "no snoring."

- In the introduction, the authors note an "increased" CVD risk of 2.14 and 1.46, pointing to Amagai et al 2010. However this was not the degree of increased risk, but relative risk.

- AMI ("acute myocardial infarction") should be spelled out at first use in the Methods

- The authors refer to "multivariate" analysis. This usually refers to having multiple simultaneous dependent variables. "Multivariable" is more appropriate here.
Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
