Reviewer's report

Title: Distribution of lipid parameters according to different socio-economic indicators- The EPIC-Norfolk prospective population study

Version: 2
Date: 19 June 2014
Reviewer: Michael Doumas

Reviewer's report:

This is a very interesting and clinically meaningful study addressing the association between socioeconomic status and blood lipid levels.

Discretionary revisions:
- The response rate was 45%, normal for a large study. A relevant comment could be incorporated.
- Non-fasting blood samples were obtained. A relevant comment might be incorporated in the discussion section.
- Physical activity might have contributed to the association between socio-economic status and blood lipids and the sex-differences described. Although mentioned, more extended discussion might be useful.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
