Reviewer’s report

Title: Assessment of measles Immunity among Infants in Maputo City, Mozambique.

Version: 2 Date: 16 June 2008

Reviewer: Julie Cliff

Reviewer’s report:

Major compulsory revisions
1. The authors have not replied to the question about the influence of the national mass measles vaccine campaign in 1979 on their choice of age cut-offs.
2. The authors state in their response to my question about the influence of HIV that there was a good seroconversion rate of 83%. They need to state consistently through the paper how they defined seroconversion, what was the rate, and whether they believe it is low or high.

Minor revisions
1. Background: fourth annual national vaccination campaigns.
2. Weight to age, height to age etc. not corrected

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
