Reviewer’s report

**Title:** From arginine methylation to ADMA: A novel mechanism with therapeutic potential in chronic lung diseases

**Version:** 1  **Date:** 17 December 2008

**Reviewer:** David E Wilcken

**Reviewer’s report:**

I think that the authors have written an excellent review of the relevance of arginine methylation to ADMA, and of the contribution of increased ADMA in the pathogenesis of pulmonary hypertension, and in respiratory disease generally. These are areas of considerable recent interest at a time when the emphasis has tended to be more in relation to ADMA and vascular disease, particularly coronary disease.

The references provided are up to date and the standard of English good. I would recommend acceptance for publication.
