Reviewer's report

Title: Dual mobility cup reduces dislocation rate after arthroplasty for femoral neck fracture

Version: 3 Date: 22 July 2010

Reviewer: Clifford W Colwell

Reviewer's report:

The authors have addressed this reviewer's concerns in the manuscript, with the major differences in dislocation rates in these cohorts due to the differences in head size. As previously discussed, this reviewer is unaware of any experienced surgeon who has not changed to 32mm heads as well to highly crossed polyethylene and therefore the most that we can take from this paper is that dislocations are now very rare, both with this implant and a number of others with the larger head sizes even utilizing the posterior approach. I believe with the authors modified manuscript, that it can now be published.

Level of interest: An article of limited interest

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
