Reviewer's report

Title: Clinical Study of the Pronator Quadratus Muscle: Anatomical Features and Feasibility of Pronator-Sparing Surgery

Version: 2 Date: 6 August 2013

Reviewer: Annelie Weinberg

Reviewer's report:

It is a well prepared paper with an important clinical issue as the distal radius fracture is one of the most operative treated fracture. Even if the results according to the soft tissue is good clinical procedure who try to preserve muscle is superior to other methods. Even not all fracture were treated under preservation of the muscle (9 out of 52) the paper show that if you do so a high rate of preserved muscles could be reached.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
