Reviewer's report

Title: Minimally invasive plate osteosynthesis with a Locking Compression Plate is superior to open reduction and internal fixation in the management of the proximal humerus fractures

Version: 2  Date: 25 January 2014

Reviewer: Frankie Leung

Reviewer's report:

This is a retrospective comparison with cohort. The fractures are mixed group. AO classification was used with little explanation. Proximal humerus fractures: Do they include 3-part 4-part fractures? As a result, the comparison is not accurate enough to produce the conclusion achieved.
