Level of interest: A paper whose findings are important to those with closely related research interests

Advice on publication: Accept without revision

The authors have repeated the experiments with a lower dose of Alendronate on another batch of animals from the same breeder that provided animals used in the higher dose of Alendronate. The results showed that the effects on inhibition of bone resorption were demonstrably more pronounced with the higher dose of Alendronate. In the lower dose group, the results just reached a level of significance.
