Reviewer's report

Title: Overuse Syndrome of the Ankle in Professional Ballet Dancers seen on MRI

Version: 2 Date: 5 November 2007

Reviewer: Harri K Pihlajamäki

Reviewer's report:

General

The changes performed by the authors have improved the manuscript. They also have acceptably given their reason for refraining from the use of any classification of the MRI findings. Based on authors' response, the use of two different MRI scanners to observe bone marrow edema can be considered acceptable for this study. I suggest publication of the manuscript.

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

Discretionary Revisions (which the author can choose to ignore)

What next?: Accept without revision

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
