Reviewer's report

Title: Experience of treating high risk prostate hyperplasia patients with a HPS120 Laser

Version: 1 Date: 8 September 2013

Reviewer: Piergustavo De Francesco

Reviewer's report:

1- This article is about "high risk" patients. What do you mean for "high risk"? What kind of disease these patients suffer from?

2- You also conducted a puncture biopsy in patients with abnormal PSA level. What were the results? If biopsy showed positive results, according to patients age, have you conducted any therapy? If yes what therapy?

3- Any patient that took oral anti-coagulant drugs has replaced these drugs with LMWH (low molecular weight heparin) or not?

4- In the discussion section you said that "a randomized comparative study showed that there is a higher probability of urethral stricture occurring in the TURP operation in confront of the 22.5 laser sheath"; is there a reference for this?

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
