Reviewer's report

Title: Outcomes after prostate cancer in France: treatments, side-effects and mortality at two years

Version: 2 Date: 9 March 2014

Reviewer: Hashim Ahmed

Reviewer's report:

This is a very nice study on the real life health outcomes through a national registry of men undergoing management of their prostate cancer. There are obvious limitations to such data such as attribution bias so comparisons between different treatments should be minimal. However, the authors have presented a thoughtful and balance presentation of what actually happens to men in a healthcare setting within France and thus provide clinically meaningful data that will be relevant to clinicians advising their patients as well as patients and families about to embark on the prostate cancer pathway. Some minor grammatical changes need to be made but I have no major changes.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
