Title: Early Results of a Novel Technique for Anterior Vaginal Wall Prolapse Repair: Anterior Vaginal Wall Darn

Version: 2
Date: 24 April 2014

Reviewer: Majid Mirzazadeh

Reviewer's report:

1-This paper presents a case series of 55 patient with about one year follow up. Although the number of cases seems reasonable for a this kind of surgeries, one year follow up is considered early reports (as mentioned in title). Durability of technique needs longer follow up.

2-The technique explained, is based on an darn technique to repair inguinal hernia, which is an old technique mainly replaced by using mesh in inguinal hernia repair.

3-The idea of using sutures, instead of mesh, to make a support for central defect has been brought up again recently by Dr. Raz.

4- Although the technique explained in this submission, could be considered a combination of darn hernia repair and Dr. Raz recent works, it adds new information about the results of this combined technique to literature and deserves to be published.

5- Patient evaluations before and after surgery is sufficient to support the data, although the role of some parts of evaluations like Q tip test for urethral hyper mobility and the result of this evaluations before and after surgery is not clear.

6-This paper needs minor language corrections.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
