Reviewer's report

Title: Uroflowmetry Nomogram in Iranian Children aged 7 to 14 years

Version: 2 Date: 18 November 2004

Reviewer: Andrew R. Willan

Reviewer's report:

General
What are the hypotheses to which these p-values refer? If they are that the root mean squares are zero, then they are irrelevant.

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)
The authors should include the p-values associated with the test hypotheses that each parameter estimated in the model is zero. That would be two p-values for each of the four models, one for the intercept and one for the slope.

Discretionary Revisions (which the author can choose to ignore)

What next?: Accept after minor essential revisions

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No
