Title: Lemon juice has protective activity in a rat urolithiasis model

Version: 1 Date: 17 August 2007

Reviewer: AMBROSE CHRISTINA

Reviewer's report:

1. It is well known that citrate is an inhibitor of urolithiasis. Many articles available to this claim. Hence I feel that it is not a new finding. But the method the authors have adopted is good. By considering the method you can accept but there is no new insight.

2. The writing is good and clear. But slight modification may perfect the style in the discussion section once again the authors have given the results.

3. The histopathological studies are extensive and correlate well the findings.

If we consider that lemon juice works for lithiasis it is worth publication.
