Reviewer's report

Title: Lemon juice has protective activity in a rat urolithiasis model

Version: 3 Date: 18 September 2007

Reviewer: Palaninathan P Varalakshmi

Reviewer's report:

The authors have provided appropriate justifications in the discussion section in the revised manuscript, in support with the previous studies. Hence, the manuscript in its present form can now be accepted for publication. However, it can be suggested that urinary profile forms the major determinations for stone assessment.

1. The manuscript can be graded as above average.
2. The manuscript falls within the scope of the Journal and is of scientific merit.
3. Experimental methods employed have been described extensively for replication.
4. The statistical analysis have been performed suitably and mentioned in the manuscript.
5. Discussion section was well explained to arrive at a novel conclusion.
6. Yes. The abstract projects the novelty of the study.
7. The manuscript is well written.

Overall, the manuscript can be accepted for publication without revision.
