Title: Prenatal diagnosis of a rare form of congenital mid-ureteral stricture: a case report and literature revisited

Version: 1 Date: 5 January 2007

Reviewer: George Kaplan

Reviewer's report:

General
The authors report a case of mid-ureteral stricture that was diagnosed antenatally. I am not sure that including Fig 1A is helpful. The GFR would be expected to be low in an infant and I suspect 66 ml/min/1.73m2 is normal for a newborn. Fig. 2 is also not needed in my opinion. The urogram I assume is a retrograde ureteropyelogram; this needs to be clearly stated. I also am not clear as to why remodeling of the renal pelvis was necessary.

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

Discretionary Revisions (which the author can choose to ignore)
