Version: 1 Date: 20 Jun 2001

Reviewer: Dr Hajime Ohigashi

Level of interest: A paper whose findings are important to those with closely related areas of research

Advice on publication: Accept without revision

Comments
This paper deals with the independent and interactive roles of citrus peel use and black tea consumptions for protection of skin SCC in a population at high risk group in Arizona, on the basis of the previous study results. While the study was still of a moderate sample scale, a significant protective effect for citrus peel and hot black tea consumption to skin SCC was found by the highly scientific approaches. The result could give a great impact to the scientific field on cancer protection (prevention).

Minor comments
Please recheck the following:
d-limonene (p.2) should be changed to d-limonene
