Reviewer's report

Title: Sporotrichoid cutaneous infection by Mycobacterium haemophilum and kansasii in an IgA-deficient man

Version: 3 Date: 31 August 2010

Reviewer: Jianzhong Zhang

Reviewer's report:

The authors reported a patient with IgA-deficiency occurred skin infection by both M. haemophilum and M. kansasii. This is an interesting case. The infection of both mycobacteria were well-documented and the patient responded well to anti-mycobacterial treatments.

However, some information should be provided. For example, although the authors described that the patient had a history of IgA-deficiency, no detection of immunoglobulin has been done. The immunoglobulin (IgG, IgM, IgA) should be described in this paper.

Since the patient was diagnosed to have IgA-deficiency, so it is necessary to describe if the patient has repeated infections.

Some spelling mistakes were found in the manuscript.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
