Reviewer’s report

Title: Graves’ disease in monozygotic twins - a case report

Version: 1 Date: 16 March 2013

Reviewer: Bingyin Shi

Reviewer’s report:

The article reported the unusual cases of monozygotic female twins developing Graves’ disease consecutively. The two cases further show that genetic background in the onset of the disease plays a very important role.

The weaknesses of the article are:

1. The references cited in the first paragraph in the Background is not strong enough to support the grounds of argument.
2. Lack of marriage and reproductive history, especially associated with the onset time of the disease.
3. For case A it can not say absolutely that it is Graves disease due to very sensitive response to antithyroid drug and relatively short overall treatment time.
4. There are more colloquial components.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
