Title: Suspected metastatic Adrenocortical Carcinoma revealing as Pulmonary Kaposi Sarcoma in Adrenal Cushing’s syndrome

Version: 1 Date: 22 May 2014

Reviewer: roSELLA LibE

Reviewer's report:

Bala et al. described an interesting case of cortisol-secreting adrenocortical tumor associated to a Kaposi Syndrome, which go into remission after cure of hypercortisolism.

The case is well written and point out the effect of cortisol on immune system, although the mechanism is not fully explained in the literature.

It would be of interest (if it's feasible) to have more details on the patient’s immune systems (before and after the adrenalectomy), as the complete blood count, eventually the CD4/CD8 ratio, the immunoglobulins.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
