Reviewer's report

Title: Suspected metastatic Adrenocortical Carcinoma revealing as Pulmonary Kaposi Sarcoma in Adrenal Cushing’s syndrome

Version: 1 Date: 9 June 2014

Reviewer: Diane Mege

Reviewer's report:

1- Minor Essential Revisions:
   a- Legends of figures vary between the manuscript (1 and 2), the legends (A, B, C) and the figures (from 1 to 3, from i to iii)
   b- The proposition of fifth type of Kaposi Sarcoma should be discussed in discussion and not only mentioned in conclusion.

2- Discretionary Revisions
   a- As Cushing syndrome, It could be interesting to precise the incidence of Kaposi Sarcoma in introduction.
   b- Can you precise the type of adrenalectomy (partial, limited, extended)? its approach (laparoscopic, open, transperitoneal, retroperitoneal)?
   c- Pathological figures have some limited interest. It should be interesting to develop their legends with explicative arrows.
   d- Table 2 should be cited in introduction and discussion when the four types are described. Tables are not usually cited in conclusion.
   e- There are too references for a case report.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
