Title: Emotionally induced galactorrhoea in a non-lactating female - "Pseudo-Lactation"

Version: 1 Date: 26 August 2014

Reviewer: Fahrettin Kelestimur

Reviewer’s report:

My major concern is the relation between galactorrhoea-hyperprolactinaemia and the presence of visual or auditory stimuli has not been adequately investigated. Presence of galactorrhoea and prolactin level should have been shown when the patient is subjected to the stimuli caused by the newborn. When the patient is not subjected to the stimuli caused by the newborn, the examination of the presence of galactorrhoea and the measurement of prolactin level should have been investigated simultaneously.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
