Reviewer's report:

Review of Prune belly syndrome

With a great interest I read the paper intituled « Prune belly Syndrome and dental anomaly association: a case report”

The dental anomalies of this rare disease have not been reported previously. As this paper contributes to medical knowledge, it could be accepted to publication in BMC Oral Health with minor essential revisions.

Major revisions:
At the end of the background section “There are a lot of reports in medical literature” they should be extensively cited and it does not appear so frequent in the references listed. The various medical and dental clinical signs described in the literature could be shown in summary table.

Minor revisions:
- In title Anomaly should be in the plural.
- Is there an international or expert consensus to give antibiotic with this impaired kidney function?
- I suggest to delete “ dental “ in the sentence “ There is no case……… in dental literature”
- Multidisciplinary treatment could be underlined in conclusion
- The reference list should be reviewed carefully.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
I declare that I have no competing interests.
