Reviewer's report

Title: Effectiveness of ovarian suspension in preventing post operative ovarian adhesions in women with pelvic endometriosis: A randomised controlled trial.

Version: 1 Date: 13 March 2011

Reviewer: Philippe R. Koninckx

Reviewer's report:

This is an important study to be performed and the protocol is overall suited to draw valid conclusions.

Discretionary Revisions
- It is unclear what the value of ultrasound is to assess adhesions (ultrasound examination assesses ovarian mobility) and whether ovarian adhesions outside the pelvis can be equally well assessed.
- The definition of severe endometriosis is not that clear: results could vary when exclusively unilateral cystic ovarian endometriosis (with side wall adhesions) was included, or bilateral, or only large plaques in the pouch of Douglas, or deep endometriosis of the rectum, rectosigmoid, sigmoid or bladder.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
