Reviewer's report

Title: Improved quality of life after surgery for pelvic organ prolapse in Nepalese women

Version: 2 Date: 30 April 2013

Reviewer: Fredrik Granath

Reviewer's report:

In general I am satisfied with the response of the authors. Concerning, comparisons with the control group, I partly disagree with the authors. The lacking time factor in the control group is in my view not all that important since they are supposed to represent some kind of random sample from the population and the expected change of QoL over a 3 month period should be small, and the QoL after intervention may therfore also be compared with the control group. However, I would not insist on such an analysis, since there may also be problems with representativity of the control group. It is therfore prudent of the authors to only state that QoL is improved in the surgery group,

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
