Reviewer's report

Title: A study of 0.5 Tesla dedicated magnetic resonance imaging for the detection of breast cancer in young, high risk women

Version: 2 Date: 26 April 2006
Reviewer: Petrina Causer

Reviewer's report:

General

----------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

----------------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

1) The MR images for Figure 2 (c), do not demonstrate what is being stated in the captions. The mass visually appears to have a persistent delayed enhancement pattern on the images. As the kinetic curve which is not shown contradicts what is being demonstrated I would recommend also including this.

2) Figure 2 (c) change well-demarcated to "smooth".

----------------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)

What next?: Accept after minor essential revisions

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No
