Reviewer's report

Title: Brazilian green propolis modulates inflammation, angiogenesis and fibrogenesis in intraperitoneal implant in mice

Version: 2
Date: 23 February 2014

Reviewer: Maria Leticia Miranda Fernandes Estevinho

Reviewer's report:

The manuscript is interesting but, in my opinion, the writing style and organization could be improved. The following changes should be carried out:
- "It has been proposed (...) peritoneal cavity".
- The objective and importance of the study should be better stated on the last paragraph of introduction.
- How many mice were used?
- How many própolis samples were used?
- Why did authors use aqueous extract? This should be well explained.
- Add the references from which methodology was adapted.
- How many repetitions were carried out of which assay?
- Add more details regarding the results for measurement of anti-angiogenic effects and fibrinogenic parameters.
- Discussion could be improved by analysing the results more deeply... It is too general. Also, the statistical analysis should be analysed in this section.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
