Title: Anti-angiogenic potential of an ethanol extract of Annona atemoya seeds in vitro and in vivo

Version: 3 Date: 11 August 2014

Reviewer: Malek Zihlif

Reviewer's report:

major point

the represent in this paper is good however there is an essential point that need to be clarify. this point deal with the toxicity of the tested extract as the work showing a good ant proliferative effect and some time I believe from the figure that there is some toxicity. the easiest way of doing so is test the extract on normal cells such as fibroblast using concentration ranging from 0-400ug/ml. this will clarify the obtained result more and may give the author more insight in their discussion.

Shortly is the effect is pure antiangiogene or pure antiprolerative or it is mix of both.

minor point

the results section has to be shorter and no need to the starting paragraph for every experiment.
