Reviewer's report

Title: Prognostic impact of Skp2, ER and PGR in male and female patients with soft tissue sarcomas

Version: 1 Date: 17 November 2012

Reviewer: Wei-Lien Wang

Reviewer's report:

This is overall a well-written paper which supports a previous finding that skp2 is a negative prognostic factor and examines ER and PR expression.

Major Compulsory Revisions: Sarcomas are very heterogeneous group so i find it a little difficult to assume that all subtypes adhere to this relationship. It would be interesting to know if the relationship is stronger in certain subtypes than others or at least present data showing ER, PR and Skp2 by histological subtype. Or if there is not enough subtypes for analysis, a comment made in the discussion section about this.

Minor Essential Revisions: Few references are missing information.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.

Declaration of competing interests:

I declare that I have no competing interests.
