Reviewer’s report

Title: Pleomorphic lobular carcinoma of the male breast with axillary lymph node involvement: a case report and review of literature

Version: 2 Date: 10 March 2014

Reviewer: Mitsuaki Ishida

Reviewer’s report:

Zahir et al. reported a case of pleomorphic lobular carcinoma occurring in a male breast with lymph node metastases.

This report is well-written, however, some minor concerns are present.

1. In Case presentation, the detailed date of liver function is needed.

2. page 3 line 4, “tumor cells show moderate to…” is needed to change “tumor cells showed moderate to …”.

3. Figure showing gynecomastia of the breast is needed.

4. The description regarding whether the acini or lobule of the breast are present or not is necessary.

5. The quality of Figure 2 is poor. Please change the high quality one.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
