Title: Factors influencing the implementation of clinical guidelines for health care professionals: a meta-review

Version: 3 Date: 5 July 2008

Reviewer: Ian Watt

Reviewer’s report:

I feel that the authors have responded adequately to the peer review comments. Furthermore I feel that the topic addressed by the article is relevant to BMC Medical Informatics and Decision Making.

However, I did find the layout of the paper a little confusing in so far as the conclusion section is quite long and comes before the discussion section. I feel much of what is now written in the conclusion could be re-labelled as discussion and merged with the existing discussion section. A new and more focused conclusion section could be written and placed at the end of the paper as is normal practice.
