Reviewer's report

**Title:** The impact of a team-based intervention on the lifestyle risk factor management practices of community nurses: Outcomes of the Community Nursing SNAP Trial

**Version:** 1  **Date:** 5 September 2012

**Reviewer:** Elizabeth Halcomb

**Reviewer's report:**

This is a well written paper that clearly describes a study of a nurse-led lifestyle risk factor management intervention. As such, the paper is highly relevant and of broad interest. Some minor comments are as follows;

1. To enhance the international transferability of the paper, some more detail around the nature of Australian community nursing and how it differs from other health systems may be helpful.

2. Pg 12 - it is unclear what is meant by n=X in the paragraph under the heading focus groups.

3. The separation of data under headings of quantitative and qualitative in the results section is somewhat distracting to the reader. Integration of data might enhance the readability and flow of these sections.

**Level of interest:** An article of outstanding merit and interest in its field

**Quality of written English:** Acceptable

**Statistical review:** No, the manuscript does not need to be seen by a statistician.
