Reviewer's report

Title: Prevalence and associated factors in burnout and psychological morbidity among substance misuse professionals

Version: 1 Date: 19 June 2007

Reviewer: Chris Lloyd

Reviewer's report:

As the authors rightly point out this is an under-researched area. The abstract is too long. They do not need to report all the actual results at this point. The use of such words as numerous studies should be avoided. The authors should use third person always. Ethical considerations should be outlined. A subheading data analysis would be useful. The authors do not report the PA results. The discussion should be expanded to discuss in some detail what the results indicate. The conclusion is too brief, it needs to sum up and say what the implications are. Table one should give numbers plus percentages.

What next?: Unable to decide on acceptance or rejection until the authors have responded to the major compulsory revisions

Level of interest: An article of limited interest

Quality of written English: Not suitable for publication unless extensively edited

Statistical review: No, the manuscript does not need to be seen by a statistician.
