Reviewer's report

Title: Development of the Chicago Food Allergy Research Surveys: Assessing Knowledge, Attitudes, and Beliefs of Parents, Physicians and the General Public

Version: 2 Date: 21 May 2009

Reviewer: Ragnhild Halvorsen

Reviewer's report:

The article is proposing and defining methods to unfold knowledge and beliefs of physicians, parents and the general public regarding children with adverse reactions to food. The methods described are complicated, but sound in the hands of experts and the results give important new insights in this area. The methods are detailed and well described, could maybe have been somewhat shortened, but this reviewer cannot see how it should be shorter without losing the important points. The data are sound and the manuscript adhere to the relevant standards. The discussion and the conclusions are to the point and sum up the findings described. The title and the abstract are absolutely relevant and convey the main points of the article. The writing is clear and understandable.

This reviewer have no major or minor comments for improvement or revisions and advice the editors to publish the manuscript in its present form.
