Reviewer's report

Title: Quality of care of patients with acute myocardial infarction in Bulgaria: a cross-sectional study

Version: 3 Date: 25 November 2008

Reviewer: Seth W. Glickman

Reviewer's report:

Minor essential Revisions: The new Table 4 for is helpful, but more information is needed in the Table. For example, Age is significantly associated with time delay, but it is unclear whether older patients or younger patients have longer delays. The same for education level - there is a significant association but it is unclear whether patients with low education or high education have longer delays (I assume the former).

You should either include more descriptive data in the table or simply indicate in the text or table for each variable that is significant whether it is old age vs young age or low education vs high education that is significant.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
