Reviewer's report

Title: Intravenous Vitamin C Administration Reduces Fatigue in Office Workers: A Double-blind Randomized Controlled Trial

Version: 1 Date: 13 November 2011

Reviewer: Sukchan Lee

Reviewer's report:

One critical issue: It is not apparent that appropriate positive controls were used in some of the experiments. If some drugs for reduction of fatigue were developed and applied to patients, the authors need to compare the results between vitamin C and known-drugs. Also, authors need to describe why they used 10 g vitamin C for this study. Kodama and Kodama (2006) reported about spme problems with the clinical control of interstitial pneumonia, or chronic fatigue syndrome, using the megadose vitamin C infusion system with dehydroepiandrosterone-cortisol annex. Mega dose can be equivocal in some case. Therefore the authors need to clearly define why they used their dose (10 g) for this experiments.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
