Title: An observational study reveals that neonatal vitamin D is primarily determined by maternal contributions: Implications of a new assay on the roles of vitamin D forms

Version: 1 Date: 18 January 2013

Reviewer: Angus Dalgleish

Reviewer's report:

Having seen this paper, it is looking at a number of different forms of Vitamin D assays for monitoring the blood of the mother and the neonate. Unsurprisingly it shows that the main form of the active component of D3 is identical in the mother and the child which, considering the child has only just been born, is not remotely surprising. I am unsure as to what all the other results from the other results mean.
