Reviewer's report:

Reviewer: I have read the above manuscript and give hereafter my comment.

Thank you for your very delicate revising manuscript.

However, authors missed very important clinical point at visceral fat area measurement.

In clinical field, visceral fat measurement has been measured in patient with metabolic syndrome (eg. DM, hypertension, fatty liver, hyperlipidemia, and other weight related chronic diseases). If your suggestive equation is applied in clinical field, you need extending the research to disease-related participants and different age groups. So your equation cannot be used weight-related patients.

But your equation is very significant suggestion at VFA in healthy groups.
