Reviewer's report

Title: Impact of milk consumption on cardiometabolic risk in postmenopausal women with abdominal obesity

Version: 1 Date: 2 November 2014

Reviewer: Abdelmonem Hassan

Reviewer’s report:

The authors should review their manuscript;
The methods section should come before the results and discussion section
The major shortcoming of this study is that the duration of the study may not be enough to see any effect of most of the parameters they assessed
Authors should provide more explanation for differences in results obtained from epidemiological studies compared to control studies and if this apply to their results
In their conclusion, they should mention the need for long term controlled study
The manuscript should be reviewed for use of the English Language; examples page 8 line 4 "through which?"
Page 8 line 11 "incident of hypertension"
Page 13 line 13 "Beginning and the end of consumption of each diet".
This expression "diet" is repeated in many parts of the manuscript. They should use the expression, completing dietary regiment for ... weeks, or consuming the X diet for .... days etc..

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
