Reviewer's report

Title: Psychosocial Correlates of Dietary Fat Intake in African American Adults: A cross-sectional study

Version: 3 Date: 20 June 2008

Reviewer: Eileen Anderson

Reviewer's report:

The authors have edited the paper to address points raised in my original review, but have done so in a way that greatly reduces interest in the paper. It is no surprise and no real contribution to the literature to conclude that personal beliefs and self-efficacy are important predictors of dietary intake and the position of the authors' now (unlike in the previous draft) is that the study was not designed to answer broader theoretical questions. I don't recommend any further revisions, the paper is now a fair assessment of what was done, I just can't recommend it as highly as previously.

Level of interest: An article of limited interest

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
