Reviewer's report

Title: Prenatal exposure to cooking gas and respiratory health in infants is modified by tobacco smoke exposure and diet. Results from the INMA birth cohort study.

Version: 2  Date: 24 September 2013

Reviewer: Deborah Jarvis

Reviewer's report:

Minor Essential revision

The following sentence is not quite right and I cannot follow the argument being made - ‘One of the factors in the etiology of otitis is the inflammation of the mucosal linings of the airy spaces, fact that is essential for the structural and functional restoration of damaged ear tissues [32]. Other factor is the increased oxidative status that has been demonstrated with the increase in serum oxidants [32,33]'

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
