Reviewer’s report

Title: Coronary Artery-Pulmonary Artery Fistula: Case Report

Version: 1 Date: 6 April 2007

Reviewer: Anca Irina Corciu

Reviewer’s report:

General

The issue presented by Quatrini et al. is a very interesting one, but to get it published the authors will have to improve it.

--------------------------------------------------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

There is no difference between the abstract and the case report presentation.
Please, add more informations about the patient: did he undergo a chest X-ray, or an ECG? Is this anomaly isolated or accompanied by other congenital heart defects? Did the patient undergo a surgical intervention after making the diagnosis of coronary artery-pulmonary artery fistula?
One of the most important parts of a case report is missing: the discussion.; for example, it would be usefull to make some comments regarding the importance of describing this anomaly, the role of transthoracic echocardiography in detection of it.

What next?: Unable to decide on acceptance or rejection until the authors have responded to the major compulsory revisions

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable
