Reviewer's report

Title: Ebsteins Anomaly: Anatomo-echocardiographic correlation

Version: 2 Date: 12 November 2007

Reviewer: lucia venneri

Reviewer's report:

General
A well written and interesting paper in the field of congenital heart disease, demonstrating that echocardiography is an excellent method for assessing Ebstein anomaly and associated abnormalities. Usually it may be the first and only imaging investigation that is required for the diagnosis and prognosis.

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

Discretionary Revisions (which the author can choose to ignore)
I have only one suggestion:
the Authors should emphasize the important role of Cardiac Magnetic Resonance- as a better noninvasive alternative to echocardiography when the last technique provides incomplete information.

What next?: Accept after discretionary revisions

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
