Major Compulsory Revisions

This is a well written and conducted study. The study's major and inherent limitation is that it is not randomised. Epidemiological studies like this one representing an important contribution to our body of knowledge in omega-3 intake and their effects on cardiovascular health. They serve to provide impetus for randomised trial. This is what is clearly needed. As the authors themselves have outlined, there is significant controversy on the role of omega-3 in diabetics with mixed clinical results. A well designed randomised trial targeting the patient group as outlined by the present results is what is needed.

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
