Reviewer’s report

Title: The effects of continuous prostacyclin infusion on regional blood flow and cerebral vasospasm following subarachnoid haemorrhage. Design and rationale for a randomized, blinded, placebo-controlled, clinical pilot trial

Version: 2 Date: 10 April 2012

Reviewer: Peter Sandercock

Reviewer’s report:

10. How will GOS be analysed (dichotomous, sliding dichotomy, ordinal or other)? There is a good case to use an ordinal analysis to maximise statistical efficiency

the authors state:

We thank the reviewer for this suggestion and we certainly will aim for an ordinal analysis which is now stated in the manuscript

I could find no mention of this in the manuscript. Please resubmit a corrected version which includes their response to this question, i.e. an explicit mention of ordinal analysis with a reference to the method to be used (there are several)
